

Exercise 11: Stash

For this exercise, you will practice stashing a change, moving branches, and then popping the stash.

Create a new branch

Let's say your project manager says, "Create a branch with international information." So you get to work.

1. In your terminal console, type the following to create the branch and move to it:

```
git checkout -b international
```

2. You are now in the `international` branch. Now open your editor and add a final paragraph: "The toothbrush can speak seven different languages." Save the file.
3. Add and commit the file to the branch.

Make some changes on the master branch

Now let's say your project manager says, "Put the international information aside for now. I want you to add requirements to the master branch." So you return to the master branch and do some work.

1. Move back to the master branch:

```
git checkout master
```

2. Now open your editor. When you reload, you will no longer see the international sentence. Add a different final paragraph: "The toothbrush requires [need info here]." This is the kind of sentence you wouldn't want to commit until you got the information that you needed. Save the file.

Stash your changes so you can move back to the international branch

You are waiting for the requirements information when the project manager appears again and says, "Can you make a quick change on the international branch? The toothbrush speaks six languages, not seven." You don't want to commit your incomplete version on master. So instead, you stash it.

1. Create a new stash

```
git stash save "Incomplete requirements"
```

2. Go back to your editor and reload the file. Your file should be how it was when you did the most recent commit. In this case, it's what you had when you created the branch.
3. Now return to the international branch.

```
git checkout international
```

4. Open your editor. You should see the language sentence. Change seven to six and save.
5. Back in your terminal, add and commit the change.

Return to working on the requirements

You did what the project manager asked for, and now you want to return to working on the requirements.

1. Return to the master branch using `git checkout master`. When you open your editor, you should not see languages sentence (that is on the international branch) or the requirements sentence (because you stashed it away).
2. View all your stacks. You should only see one stash listed.

```
git stash list
```

3. Pop your stash off the stash stack, and you will be returned to the place you were before you had to switch to the international branch.

```
git stash pop
```

4. Now go back to the editor. You should see the requirements sentence that you started working on.
5. Back in the terminal console, list your stashes using `git stash list`. There should be no stashes listed.
