

Exercise 7: Going Back in Time

For this exercise, you will see how you can use Git to bring up an earlier version of

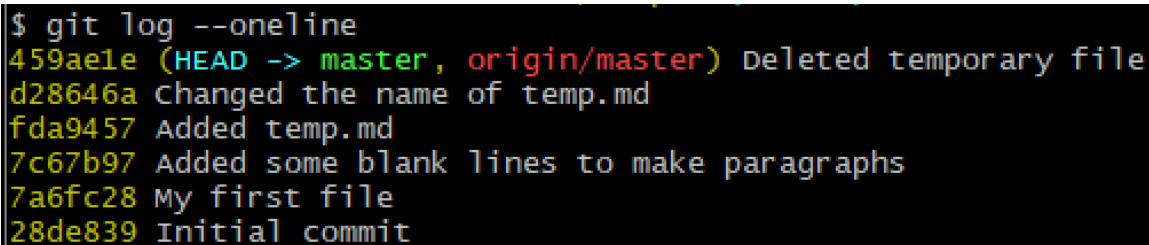

1. Open your text editor so you can see the **docs.md** file. Notice that it says that the toothbrush is totally safe.
2. Now go back to your terminal and look at the Git log, showing one line for each log entry

```
git log --oneline
```

3. The output should look like below. Copy the ID of the commit right above the one labeled "Initial commit". (7a6fc28 in my example.) This is the commit where you added the **docs.md** file.

Note: In Windows, control-C doesn't work as a short cut for copy in git bash. This is because command-line interfaces were created before the control-C and control-V conventions. The simplest is to select, right-click, and choose Copy.

Note: GitHub has changed the name of the main branch from **master** to **main**. So in the screenshot below, where it says **master**, expect it to say **main**.

```
$ git log --oneline
459ae1e (HEAD -> master, origin/master) Deleted temporary file
d28646a Changed the name of temp.md
fda9457 Added temp.md
7c67b97 Added some blank lines to make paragraphs
7a6fc28 My first file
28de839 Initial commit
```

4. Checkout that commit, pasting the ID at the end. (Again, for Windows git bash, you should right-click and choose Paste.)

```
git checkout 7a6fc28
```

5. Return to your editor and reload the file if necessary. Notice that the file is now the first version that you created.
6. Checkout the latest commit to return to your latest version.

```
git checkout main
```

7. Return to your text editor, reload if necessary, and verify that you are at the latest version again.
