

Exercise 13: Cloning

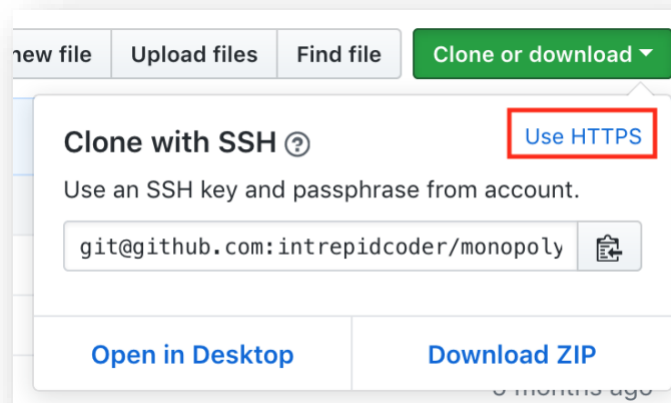

There are thousands and thousands of open source projects on GitHub. If you ever wanted to help with documentation of these projects, the first thing you would need to do is to clone the repository. For this exercise, you will clone a public repository of an open source project from GitHub.

Follow these steps:

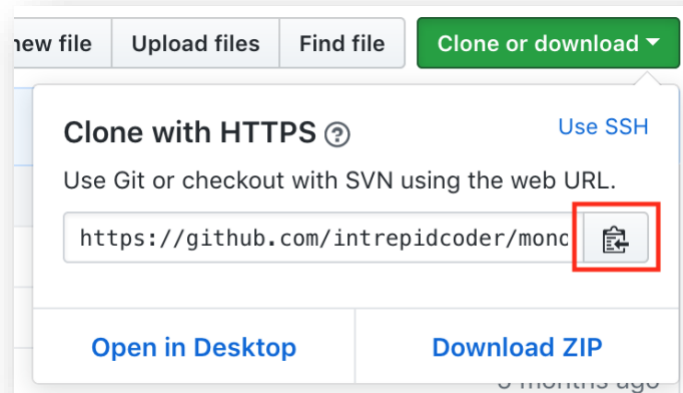

1. In a browser, open <http://github.com>
2. In the top left search bar, type in the name of a board game you like: chess, monopoly, dungeons and dragons, etc. Press the return key to search.

3. Click on any of the projects that come back to open the project.
4. Click the **Clone or download** button.
5. Click the **Use HTTPS** button.

- Click the “Copy to clipboard” icon to copy the URL to your clipboard.

- Open the terminal console.
- Change to your home directory: `cd ~`
- Type `git clone` and then type a space.
- Paste the clipboard into the terminal console and hit enter. It should look something like this:

```
git clone https://github.com/intrepidcoder/monopoly.git
```

- Wait for the repository to be downloaded.
- Open File Explorer (Windows) or Finder (Mac).
- Go to your home directory. For Windows, C drive, then Users, then your username. For Mac, it's your main hard drive, then Users, then your username.
- Look for a directory that has the same name as the repository you downloaded. Spend a little time exploring it and look at what files have been downloaded.
- You won't need it anymore, so you can delete the folder now.
