

Exercise 8: Tags

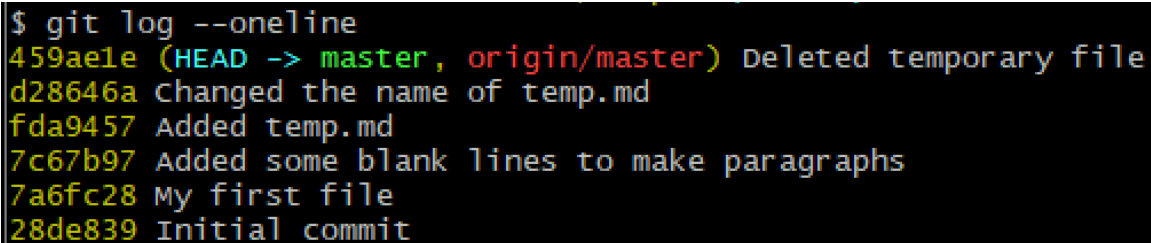

For this exercise, you will create a tag for a previous commit and use it.

1. Open your terminal console in the `exercise` directory.
2. List the log with the “oneline” flag.

```
git log --oneline
```

3. The output should look like below. Choose a commit and copy the ID of the commit.

Note: Remember, in Windows, to copy you should right-click, and choose Copy.

A terminal window with a black background and white text showing the output of the command 'git log --oneline'. The output lists seven commits from top to bottom: '459ae1e (HEAD -> master, origin/master) Deleted temporary file', 'd28646a Changed the name of temp.md', 'fda9457 Added temp.md', '7c67b97 Added some blank lines to make paragraphs', '7a6fc28 My first file', '28de839 Initial commit', and an empty line at the bottom.

```
$ git log --oneline
459ae1e (HEAD -> master, origin/master) Deleted temporary file
d28646a Changed the name of temp.md
fda9457 Added temp.md
7c67b97 Added some blank lines to make paragraphs
7a6fc28 My first file
28de839 Initial commit
```

4. Checkout that commit.

```
git checkout d286646a
```

5. Add a tag for that commit with a name of `exerTag` and a description of “Tag for exercise 8”:

```
git tag -a exerTag -m "Tag for exercise 8"
```

6. Now return to the most recent commit:

```
git checkout master
```

7. Verify that you are back at the most recent, by either doing an `ls` command or looking in your editor. (It depends on which commit you moved back to, what you are looking for.)

8. Now checkout your tag:

```
git checkout tags/exerTag
```

9. Verify that you are at the old commit. Again, you can look for files or look for changes within a file, using the editor.

10. Finally, return to master so that you don't accidentally make a change in the past:

```
git checkout master
```

11. Your tag is only local now. If you want to see your tag on GitHub, do:

```
git push origin exerTag
```

12. Go to GitHub, and you can click on the Branch dropdown and choose the **Tags** tab to see your tag.
